

Storage and transportation studies of amphetamine, methamphetamine, benzoylecgonine, phencyclidine, morphine, oxycodone, and ∆9- tetrahydrocannabinol in the Quantisal™ collection device Cynthia Coulter, Margaux Garnier, James Tuyay, Christine Moore, Immunalysis Corporation, Pomona, CA, U.S.A.

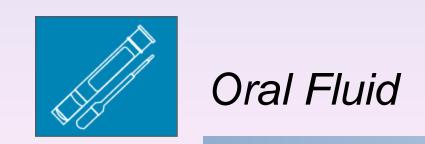

Background

- ➤ An investigation into the stability of drugs in oral fluid using the Quantisal TM collection device during normal storage and transportation conditions was carried out.
- The objective was to determine optimal conditions for sample handling for both collector and laboratory.
- >Three separate experiments were conducted
 - > stability at room temperature (25°C)
 - > stability at refrigerated temperature (4°C)
 - > stability during overnight transportation

Method

- ➤ Drug concentration was determined by:
 ➤ LC-MS/MS for amphetamine (AMP),
 methamphetamine (METH), benzoylecgonine
 (BZE), phencyclidine (PCP), morphine (MOR),
 and oxycodone (OXYC)
 - >GC-MS for ∆9-tetrahydrocannabinol (THC)
- All methods are fully validated and tested against both proficiency and real user specimens.

Experiment

- >50mL of neat oral fluid was collected, pooled, and divided into two 25mL aliquots
- ➤ Multi-analyte drug solutions were prepared at:
 - > -50% (solution A) and +50% (solution B) of the cutoff
- ➤ Cutoff concentrations:
- > AMP (50ng/mL), METH (50ng/mL), BZE (15ng/mL), PCP (10ng/mL)
- ➤MOR 30ng/mL), OXYC (30ng/mL), THC (4ng/mL)
- >16 collection pads soaked up 1mL of fortified oral fluid for each level.
- ➤ When the collection pad indicator turned blue each pad was placed into a corresponding labeled tube
- Samples were stored at room temperature in the dark and analyzed in duplicate at time points 0, 7, 14, and 30 days.
- >Samples were stored at 4°C and analyzed in duplicate at time points 14 and 30 days
- ➤ After analysis at time zero, specimens were packed in a thermo container which included temperature and humidity logs; shipped overnight to the East coast and back for analysis

Results

- ➤ An analytical result within +-20% of the original value (day zero) was considered to be an acceptable analytical variable
- ➤ All drugs except THC were within this range up to day 30 when stored at room temperature in the dark
- >THC showed a 30% and 25% loss for solutions A and B respectively by day 7 with a 60% and 30% loss by day 30
- ➤At refrigerated temperature (4°C) all drugs at all times points for both solutions A and B showed minor degradation and were within +-20% range
- ➤THC showed a 10% and 2% loss for solutions A and B by day 30 when stored at refrigerated temperature
- ➤The temperature during overnight transportation ranged from 14.8 30.1°C; no significant loss was seen for any drug
- ➤ The low concentration THC solution had a minor loss of 10% while the +50% solution had a loss of 3%

Conclusion

- ➤ Drugs are stable within the Quantisal[™] oral fluid collection device when shipped overnight without cold packs in regulation containers.
- ➤Once received into the laboratory the Quantisal™ device should be stored refrigerated at 4°C especially if THC analysis is required.
- Samples should be analyzed within the first week of receiving but can be stored for at least 30 days without significant loss. This has proven to be helpful for re-analysis purposes.
